

SMART COMMUNITY

IDT Group Project • Sustainable Cities and Communities

Ready-to-use website-building prompt

A lightweight, clean and presentable community-management website prototype for a college IDT project.

Project type	Lite college-level web prototype
Purpose	Help residents manage everyday local civic needs
Core theme	Sustainable Cities and Communities
Priority	Simple • Functional • Clean • Easy to demonstrate

1. Main Dashboard

- Community name and location
- Current weather and temperature
- Simple weather condition/forecast
- Community announcements
- Quick actions: Report a Problem, Emergency Services, Community Map and Complaints

2. Weather

- Temperature and current condition
- Basic forecast
- Rain/weather alert
- Use sample/mock data if a live API is unavailable

3. Emergency Services

- Nearest hospital
- Nearest police station
- Emergency contact numbers
- Call and directions/map buttons
- Sample locations are acceptable

4. Civic Problem Reporting

- Report potholes, broken streetlights, garbage, waterlogging, drainage problems and other issues
- Fields: category, description, location and optional photo
- Show a confirmation after submission

5. Complaint Tracking

- Show submitted issues in a simple list
- Status flow: **Submitted** → **Verified** → **In Progress** → **Resolved**
- Make the current status visually clear

6. Community Map

- Show reported civic problems
- Markers for road problems, garbage, streetlights, waterlogging and other complaints
- Use a simple mock map if a real map API is unavailable

7. Municipality Complaint Box

- Complaint title, description, category and location
- Submit complaint button
- Show complaint status
- For this lite prototype, simulate the workflow rather than integrating with a real government system

8. Community Announcements

- Road maintenance
- Water-supply interruptions
- Garbage-collection schedules
- Community meetings and local alerts

9. Sustainability & Community Impact

- Cleaner streets
- Safer neighborhoods
- Better waste management
- Improved infrastructure
- Citizen participation
- Show simple demo statistics such as 24 Issues Reported, 18 Resolved, 6 In Progress

Design & Technical Brief

Visual style: Simple, clean, modern, minimal and professional.

Responsiveness: Work well on desktop and mobile screens.

Layout: Use cards, icons, clear buttons, status indicators and generous spacing.

Navigation: Home | Services | Report Issue | Map | Complaints

Primary action: Keep a prominent “Report a Problem” button.

Avoid: Excessive animations, complicated layouts and unnecessary features.

Technical Requirements

- Prefer **HTML, CSS and JavaScript**.
- Use APIs only when they improve the demonstration.
- If a database is needed, use Firebase or Supabase.
- Use mock/sample data where appropriate.
- Keep the code understandable for a student group.

Demo Flow

- Resident opens the dashboard.
- Checks weather or emergency services.
- Reports a pothole or another civic problem.
- Issue appears in the complaint section.
- Status moves through the tracking workflow.
- Dashboard shows community impact.

Project Boundary

This is a **lite IDT project**, not a production-ready civic platform. Focus on demonstrating the concept, user experience, sustainability connection and problem-solving approach. Avoid overengineering.

Suggested Project Statement

“Smart Community is a lightweight digital platform designed to connect residents with essential local information and civic issue reporting, helping communities become safer, cleaner, better managed and more sustainable.”
